Abstract of FR2825264

The invention concerns a band not provided with a dilatable portion characterised in that it comprises different successive separate zones (A, B, C) formed on its entire developed length, while forming a single-piece and single-unit assembly, and its two ends (1a), (1b) are specifically configured to form flexible nesting and position-locking male-female parts by defining a first head zone (A) and a second rear end anchoring zone (B) forming a main tip and integrated into each other, and between said two zones, the ring comprises a third intermediate connecting zone (C) with solid cross-section over the main part of its length, designed to be more specifically pressed on the part of the stomach to be enclosed.
